Relations and Functions

Previous Years' CBSE Board Questions

1.2 Types of Relations

MCQ

- Let A = [3, 5]. Then number of reflexive relations on A
 - (a) 2
- (b) 4

(c) 0

- (d) 8
- (2023)
- Let R be a relation in the set N given by $R = \{(a, b) : a = b - 2, b > 6\}$. Then
 - (a) (8,7)∈ R
- (b) (6,8) ∈ R
- (c) (3,8) ∈ R
- (d) (2, 4) ∈ R
- (2023)
- 3. A relation R is defined on N. Which of the following is the reflexive relation?
 - (a) R = {(x, y): x > y, x, y ∈ N}
 - (b) R = {(x, y): x + y = 10, x, y ∈ N}
 - (c) R = {(x, y): xy is the square number, x, y ∈ N}
 - (d) R = {(x, y): x + 4y = 10, x, y ∈ N}

(Term I, 2021-22) An

- The number of equivalence relations in the set [1, 2, 3] containing the elements (1, 2) and (2, 1) is
 - (a) 0
- (b) 1
- (c) 2

- (d) 3 (Term I, 2021-22)
- A relation R is defined on Z as aRb if and only if $a^2 - 7ab + 6b^2 = 0$. Then, R is
 - (a) reflexive and symmetric
 - (b) symmetric but not reflexive
 - (c) transitive but not reflexive
 - (d) reflexive but not symmetric

(Term I, 2021-22) (Ap)

- Let A = {1, 3, 5}. Then the number of equivalence relations in A containing (1, 3) is
 - (a) 1
- (b) 2
- (c) 3

- (d) 4
- (2020)
- The relation R in the set $\{1, 2, 3\}$ given by $R = \{(1, 2), 2, 3\}$ (2, 1), (1, 1)} is
 - (a) symmetric and transitive, but not reflexive
 - (b) reflexive and symmetric, but not transitive
 - (c) symmetric, but neither reflexive nor transitive
 - an equivalence relation

(2020)

VSA (1 mark)

- Write the smallest reflexive relation on set $A = \{a, b, c\}$. (2021 C)
- $(a_1, a_2) \in R$ A relation R in a set A is called ___ (2020) R implies $(a_2, a_1) \in R$, for all $a_1, a_2 \in A$.
- 10. A relation in a set A is called . relation, if each element of A is related to itself. (2020) R
- If R = {(x, y) : x + 2y = 8} is a relation on N, write the range of R.

- 12. Let R = {(a, a3): a is a prime number less than 5} be a relation. Find the range of R. (Foreign 2014)
- 13. Let R be the equivalence relation in the set $A = \{0, 1, 2, 3, 4, 5\}$ given by $R = \{(a, b) : 2 \text{ divides } (a - b)\}.$ Write the equivalence class [0]. (Delhi 2014 C)

SAI (2 marks)

- Check if the relation R in the set R of real numbers defined as $R = \{(a, b) : a < b\}$ is (i) symmetric, (ii) transitive.
- 15. Let W denote the set of words in the English dictionary. Define the relation R by $R = \{(x, y) \in W \times W \text{ such that } x \text{ and } y \text{ have at least one } \}$ letter in common). Show that this relation R is reflexive and symmetric, but not transitive. (2020)

LAI (4 marks)

- Show that the relation R in the set A = {1, 2, 3, 4, 5, 6} given by $R = \{(a, b) : |a - b| \text{ is divisible by 2}\}$ is an equivalence relation.
- 17. Check whether the relation R defined on the set $A = \{1, 2, 3, 4, 5, 6\}$ as $R = \{(a, b) : b = a + 1\}$ is reflexive, symmetric or transitive.
- Show that the relation R on the set Z of all integers, given by
 - $R = \{(a, b) : 2 \text{ divides } (a b)\} \text{ is an equivalence relation.}$ (2019)
- 19. Show that the relation R on R defined as $R = \{(a,b): a \le b\}$, is reflexive and transitive but not symmetric. (NCERT, Delhi 2019)
- Show that the relation S in the set A={x∈Z:0≤x≤12} given by $S = \{(a, b) : a, b \in \mathbb{Z}, |a - b| \text{ is divisible by 3}\}$ is an equivalence relation. (Al 2019) Ap
- 21. Let A = {1, 2, 3, ..., 9} and R be the relation in $A \times A$ defined by (a, b) R (c, d) if a + d = b + cfor (a, b), (c, d) in $A \times A$. Prove that R is an equivalence relation. Also obtain the equivalence class [(2, 5)].

(Delhi 2014)

(2019)

- 22. Let R be a relation defined on the set of natural numbers N as follow:
 - $R = \{(x, y) \mid x \in N, y \in N \text{ and } 2x + y = 24\}$ Find the domain and range of the relation R. Also, find if R is an equivalence relation or not.

(Delhi 2014 C) An

LA II (5/6 marks)

If N denotes the set of all natural numbers and R is the relation on $N \times N$ defined by (a, b) R (c, d), if ad(b + c) = bc(a + d). Show that R is an equivalence relation. (2023, Delhi 2015)

- Let A = {x ∈ Z : 0 ≤ x ≤ 12}. Show that R = {(a, b) : a, b ∈ A, a - bl is divisible by 4], is an equivalence relation. Find the set of all elements related to 1. Also write the equivalence class [2].
- Show that the relation R in the set A = {1, 2, 3, 4, 5} given by $R = \{(a, b) : |a - b| \text{ is divisible by 2}\}\$ is an equivalence relation. Write all the equivalence classes of R.

1.3 Types of Functions

MCO

- 26. The function $f: R \rightarrow R$ defined by $f(x) = 4 + 3 \cos x$ is
 - (a) bijective
- (b) one-one but not onto
- (c) onto but not one-one
- (d) neither one-one nor onto (Term I, 2021-22) [Aii]
- The number of functions defined from

 $\{1, 2, 3, 4, 5\} \rightarrow \{a, b\}$ which are one-one is

(a) 5

(c) 2

- (Term I, 2021-22)
- 28. Let $f: R \to R$ be defined by f(x) = 1/x, for all $x \in R$, Then,
 - (a) one-one
- (b) onto
- (c) bijective
- (d) not defined

(Term I, 2021-22)

The function f: N → N is defined by

$$f(n) = \begin{cases} \frac{n+1}{2}, & \text{if } n \text{ is odd} \\ \frac{n}{2}, & \text{if } n \text{ is even} \end{cases}$$

The function f is

- (a) bijective
- (b) one-one but not onto
- (c) onto but not one-one
- (d) neither one-one nor onto

(Term I, 2021-22) Ev

VSA (1 mark)

 If f = {(1, 2), (2, 4), (3, 1), (4, k)} is a one-one function from set A to A, where A = {1, 2, 3, 4}, then find the value of k. (2021 C)

LAI (4 marks)

31. Case Study: An organization conducted bike race under two different categories - Boys and girls. There were 28 participants in all. Among all of them, finally three from category 1 and two from category 2 were selected for the final race. Ravi forms two sets B and G with these participants for his college

Let $B = \{b_1, b_2, b_3\}$ and $G = \{g_1, g_2\}$, where B represents the set of Boys selected and G the set of Girls selected for the final race.

Based on the above information, answer the following questions.

- How many relations are possible from B to G?
- (ii) Among all the possible relations from B to G, how many functions can be formed from B to G?
- (iii) Let R: B → B be defined by R = {(x, y) : x and y are students of the same sex). Check if R is an equivalence relation.

A function $f: B \rightarrow G$ be defined by $f = \{(b_1, g_1), (b_2, g_2), (b_3, g_4), (b_4, g_4), (b_5, g_4), (b_6, g_4),$ (b3, g1). Check if f is bijective, justify your answer.

32. Let $f: \mathbb{R} - \left\{-\frac{4}{3}\right\} \to \mathbb{R}$ be a function defined as $f(x) = \frac{4x}{3x+4}$. Show that f is a one-one function. Also,

check whether f is an onto function or not.

 Show that the function f: (-∞, 0) → (-1, 0) defined by $f(x) = \frac{x}{1+|x|}, x \in (-\infty, 0) \text{ is one-one and onto.}$ (2020)

CBSE Sample Questions

1.2 Types of Relations

MCQ

- 1. A relation R in set A = [1, 2, 3] is defined as R = {(1, 1), (1, 2), (2, 2), (3, 3)}. Which of the following ordered pair in R shall be removed to make it an equivalence relation in A?
 - (a) (1, 1) (b) (1, 2) (c) (2, 2)

- (d) (3, 3)

(Term I, 2021-22) [An]

- Let the relation R in the set A = {x ∈ Z : 0 ≤ x ≤ 12}, given by $R = \{(a, b) : |a - b| \text{ is a multiple of 4.} \}$ Then [1], the equivalence class containing 1, is
 - (a) [1, 5, 9]
- (b) {0, 1, 2, 5}

(c) o

(d) A

(Term I, 2021-22) Ev

VSA (1 mark)

How many reflexive relations are possible in a set A whose n(A) = 3? (2020-21) Ap A relation R in S = {1, 2, 3} is defined as R = {(1, 1), (1, 2), (2, 2), (3, 3)}. Which element(s) of relation R be removed to make R an equivalence relation?

(2020-21)

 An equivalence relation R in A divides it into equivalence classes A₁, A₂, A₃. What is the value of A₁ ∪ A₂ ∪ A₃ and A₁ ∩ A₂ ∩ A₃. (2020-21)

SAI (2 marks)

 Let R be the relation in the set Z of integers given by R = {(a, b): 2 divides a - b}. Show that the relation R is transitive? Write the equivalence class of 0.

(2020-21) Ap

SAII (3 marks)

Check whether the relation R in the set Z of integers defined as R = {(a, b) : a + b is "divisible by 2"} is reflexive, symmetric or transitive. Write the equivalence class containing 0, i.e., [0]. (2020-21)

LA II (5/6 marks)

Given a non-empty set X, define the relation R on P(X) as:

For $A, B \in P(X)$, $(A, B) \in R$ iff $A \subset B$. Prove that R is reflexive, transitive, and not symmetric. (2022-23)

Define the relation R in the set N × N as follows:
 For (a, b), (c, d) ∈ N × N, (a, b) R (c, d) iff ad = bc. Prove that R is an equivalence relation in N × N. (2022-23)

1.3 Types of Functions

MCQ

- Let A = {1, 2, 3}, B = {4, 5, 6, 7} and let f = {(1, 4), (2, 5), (3, 6)} be a function from A to B. Based on the given information, f is best defined as
 - (a) Surjective function (b) Injective function
 - c) Bijective function (d) Function

(Term I, 2021-22) Ev

- 11. The function $f: R \to R$ defined as $f(x) = x^3$ is
 - (a) One-one but not onto
 - (b) Not one-one but onto
 - (c) Neither one-one nor onto
 - (d) One-one and onto

(Term I, 2021-22)

VSA (1 mark)

- Check whether the function f: R → R defined as f(x) = x³ is one-one or not. (2020-21)
- A relation R in the set of real numbers R defined as R={(a,b): √a = b} is a function or not. Justify (2020-21)

(2020-2

Detailed **SOLUTIONS**

Previous Years' CBSE Board Questions

1. (b): Total number of reflexive relations on a set having n number of elements = 2^{n^2-n}

Here, n = 2

- :. Required number of reflexive relations = 2^{2²-2} = 2⁴⁻² = 2² = 4
- (b): Given, R = {(a, b): a = b 2, b > 6}

Since, b > 6, so (2, 4) ∉ R

Also, (3, 8) ∉ R as 3 ≠ 8 − 2

and (8, 7) ∉ R as 8 ≠ 7 - 2

Now, for (6, 8), we have

8 > 6 and 6 = 8 - 2, which is true

- ∴ (6,8) ∈ R
- 3. (c) : Consider, $R = \{(x, y) : xy \text{ is the square number, } x, y \in N\}$ As, $xx = x^2$, which is the square of natural number x.

 \Rightarrow $(x, x) \in R$. So, R is reflexive.

Concept Applied (6)

- A relation R in a set A is called reflexive, if (a, a) ∈ R, for all a ∈ A.
- (c): Equivalence relations in the set {1, 2, 3} containing the elements (1, 2) and (2, 1) are
 R₁ = {(1, 2), (2, 1), (1, 1), (2, 2), (3, 3)}

 $R_2 = \{(1, 2), (2, 1), (1, 3), (3, 1), (2, 3), (3, 2), (1, 1), (2, 2), (3, 3)\}$

:. Number of equivalence relations is 2.

Concept Applied (6)

- A relation R in a set A is called an equivalence relation, if R is reflexive, symmetric and transitive.
- (d): Given, aRb, a, b ∈ Z

Reflexive : For $a \in Z$, we have

 $a^2 - 7a \cdot a + 6a^2 = a^2 - 7a^2 + 6a^2 = 0 \Rightarrow (a, a) \in R$

Relation is reflexive.

Symmetric: Since, $(6, 1) \in R$

As, $6^2 - 7 \times 6 \times 1 + 6 \times 1^2 = 36 - 42 + 6 = 0$

But $(1,6) \notin R$ Relation is not symmetric.

 (b): Equivalence relations in the set containing the element (1, 3) are

 $R_1 = \{(1, 1), (3, 3), (1, 3), (3, 1), (5, 5)\}$

 $R_2 = \{(1, 1), (3, 3), (5, 5), (1, 5), (5, 1), (3, 5), (5, 3), (1, 3), (3, 1)\}$

- .: There are 2 possible equivalence relations.
- (c): Given R = {(1, 2), (2, 1), (1, 1)} is a relation on set {1, 2, 3}

Reflexive: Clearly $(2, 2), (3, 3) \notin R$

R is not a reflexive relation.

Symmetric: Now, $(1, 2) \in R$ and $(2, 1) \in R$.: R is symmetric. Transitive: Now, $(2, 1) \in R$ and $(1, 2) \in R$ but $(2, 2) \notin R$

R is not transitive relation.

R is symmetric, but neither reflexive nor transitive.

We have, A = {a, b, c}

A relation R on the set A is said to be reflexive if $(a, a) \in R$, $\forall a \in A$

- ∴ R = {(a, a), (b, b), (c, c)} is the required smallest reflexive relation on A.
- A relation R in a set A is called symmetric, if (a₁, a₂) ∈ R implies (a₂, a₁) ∈ R, for all a₁, a₂ ∈ A.
- A relation in a set A is called reflexive relation, if each element of A is related to itself.
- 11. Here, $R = \{(x, y) : x + 2y = 8x, y \in N\}$.

For x = 1, 3, 5, ...

x + 2y = 8 has no solution in N.

For x = 2, we have $2 + 2y = 8 \Rightarrow y = 3$

For x = 4, we have $4 + 2y = 8 \Rightarrow y = 2$

For x = 6, we have $6 + 2y = 8 \Rightarrow y = 1$

For x = 8, 10, ...

x + 2y = 8 has no solution in N.

- .. Range of $R = \{y : (x, y) \in R\} = \{1, 2, 3\}$
- 12. Given relation is

 $R = \{(a, a^3) : a \text{ is a prime number less than 5}\}.$

- .. R = {(2, 8), (3, 27)}. So, the range of R is {8, 27}.
- Here, R = {(a, b): 2 divides (a b)}
- ∴ Equivalence class of [0] = {a ∈ A : (a, 0) ∈ R}.
- \Rightarrow (a-0) is divisible by 2 and $a \in A \Rightarrow a = 0, 2, 4$ Thus $[0] = \{0, 2, 4\}$.
- 14. We have, R = {(a, b): a < b}, where a, b ∈ R</p>
- (i) Symmetric: Let (x, y) ∈ R, i.e., x R y ⇒ x < y

But y < x, so $(x, y) \in R \Rightarrow (y, x) \notin R$

Thus, R is not symmetric.

- (ii) Transitive : Let (x, y), (y, z) ∈ R
- $\Rightarrow x < y \text{ and } y < z \Rightarrow x < z$
- ⇒ (x, z) ∈ R. Thus, R is transitive.
- 15. We have, $R = \{(x, y) \in W \times W : x \text{ and } y \text{ have at least one letter in common}\}$

Reflexive : Clearly $(x, x) \in R$, because same words will contains all common letters.

⇒ R is reflexive.

Symmetric: Let $(x, y) \in R$ i.e., x and y have at least one letter in common.

- ⇒ y and x will also have at least one letter in common.
- \Rightarrow $(y, x) \in R$
- ⇒ R is symmetric.

Transitive: Let, x = LAND, y = NOT and z = HOT

Clearly $(x, y) \in R$ as x and y have a common letter and $(y, z) \in R$ as y and z have 2 common letters.

but $(x, z) \notin R$ as x and z have no letter in common. Hence, R is not transitive.

Concept Applied (6)

- A relation R in a set A is not transitive if for (a, b) ∈ R and (b, c) ∈ R but (a, c) ∉ R
- 16. We have, $A = \{1, 2, 3, 4, 5, 6\}$ and $R = \{(a, b) : |a b| \text{ is divisible by 2}\}$
- (i) Reflexive: For any a ∈ A
 |a a| = 0, which is divisible by 2.
 Thus, (a, a) ∈ R. So, R is reflexive.

- (ii) Symmetric: For any a, b ∈ A Let (a, b) ∈ R
- \Rightarrow |a-b| is divisible by $2 \Rightarrow |b-a|$ is divisible by 2
- \Rightarrow $(b,a) \in R$: $(a,b) \in R$ \Rightarrow $(b,a) \in R$: R is symmetric.
- (iii) Transitive: For any a, b, c ∈ A

Let $(a, b) \in R$ and $(b, c) \in R$

- ⇒ |a b| is divisible by 2 and |b c| is divisible by 2.
- $\Rightarrow a-b=\pm 2 k_1$ and $b-c=\pm 2k_2 \forall k_1, k_2 \in N$
- \Rightarrow $a-b+b-c=\pm 2(k_1+k_2) \Rightarrow a-c=\pm 2k_3 \forall k_3 \in N$
- \Rightarrow |a-c| is divisible by $2 \Rightarrow (a,c) \in R$ \therefore R is transitive. Hence, R is an equivalence relation.
- 17. We have, $A = \{1, 2, 3, 4, 5, 6\}$ and a relation R on A defined as $R = \{(a, b) : b = a + 1\}$

Reflexive : Let $(a, a) \in R$

- $\Rightarrow a = a + 1 \Rightarrow a a = 1 \Rightarrow 0 = 1$, which is not possible.
- ∴ (a, a) ∉ R ⇒ R is not reflexive.

Symmetric: Let $(a, b) \in R \Rightarrow b = a + 1$...(i)

Now, if $(b, a) \in R$

- $\Rightarrow a = b + 1 \Rightarrow b = b + 1 + 1$ (using (i))
- \Rightarrow $b=b+2 \Rightarrow b-b=2 \Rightarrow 0=2$, which is not possible
- \Rightarrow $(b, a) \notin R \Rightarrow R \text{ is not symmetric.}$

Transitive: Let $(a, b) \in R$ and $(b, c) \in R$

- \Rightarrow b=a+1 and $c=b+1 \Rightarrow c=a+1+1$
- \Rightarrow $c = a + 2 \neq a + 1 \Rightarrow (a, c) \notin R \Rightarrow R \text{ is not transitive.}$
- 18. We have, $R = \{(a, b) : 2 \text{ divides } (a b)\}$

Reflexive: For any $a \in Z$, a - a = 0 and 2 divides 0.

⇒ (a, a) ∈ R for every a ∈ Z ∴ R is a reflexive.

Symmetric: Let $(a, b) \in R$

- ⇒ 2 divides (a b)
- \Rightarrow a b = 2m, for some $m \in Z$
- \Rightarrow b-a=2m
- ⇒ 2 divides b a
- \Rightarrow $(b,a) \in R$
- .. R is symmetric.

Transitive: Let $(a, b) \in R$ and $(b, c) \in R$

- ⇒ 2 divides (a b) and 2 divides (b c)
- $\Rightarrow a-b=2m$ and b-c=2n for some $m, n \in \mathbb{Z}$
- $\Rightarrow a-b+b-c=2m+2n$
- $\Rightarrow a-c=2(m+n)$
- ⇒ 2 divides a c
- \Rightarrow $(a,c) \in R$
- .. R is transitive.

Hence, R is an equivalence relation.

- We have, R={(a,b):a≤b, a,b∈R}
- (i) Reflexive: Since a ≤ a :. aRa ∀ a∈R

Hence, R is reflexive.

(ii) Symmetric: $(a,b) \in R$ such that $aRb \Rightarrow a \leq b \implies b \leq a$ So, $(b,a) \notin R$.

Hence, R is not symmetric.

(iii) Transitive: Let $a, b, c \in R$ such that aRb and bRc

Now, $aRb \Rightarrow a \le b$... (i) and $bRc \Rightarrow b \le c$

From (i) and (ii), we have $a \le b \le c \Rightarrow a \le c$: aRc

... (ii)

Hanne valeties Die terreities

Hence, relation R is transitive.

- 20. We have, $A = \{x \in Z : 0 \le x \le 12\}$
- $A = \{0, 1, 2, 3, \dots, 12\}$

Also, $S = \{(a,b): a,b \in \mathbb{Z}, |a-b| \text{ is divisible by } 3\}$

(i) Reflexive: For any a ∈ A, |a-a|=0, which is divisible by 3

Thus, $(a,a) \in S$: S is reflexive.

(ii) Symmetric: Let (a, b) ∈ S

⇒ |a-b|is divisible by 3.

 \Rightarrow |b-a| is divisible by $3 \Rightarrow (b,a) \in S$ i.e. $(a,b) \in S \Rightarrow (b,a) \in S$

.. S is symmetric.

(iii) Transitive:

Let $(a, b) \in S$ and $(b, c) \in S$

 \Rightarrow |a-b| is divisible by 3 and |b-c| is divisible by 3.

⇒ $(a - b) = \pm 3k_1$ and $(b - c) = \pm 3k_2$; $\forall k_1, k_2 \in N$

 \Rightarrow $(a-b)+(b-c)=\pm 3(k_1+k_2)$

⇒ $(a-c) = \pm 3(k_1 + k_2)$; $\forall k_1, k_2 \in N$

⇒ |a - c| is divisible by 3 ⇒ (a, c) ∈ S : S is Transitive.

Hence, 5 is an equivalence relation.

Concept Applied (©)

A relation R in a set A is called

(i) reflexive, if (a, a) ∈ R, for all a ∈ A

(ii) symmetric, if (a, b) ∈ R ⇒ (b, a) ∈ R, for all a, b ∈ A

(iii) transitive, if $(a, b) \in R$ and $(b, c) \in R \Rightarrow (a, c) \in R$, for all $a, b, c \in A$

21. Given A = {1, 2, 3, 4,...,9}

To show: R is an equivalence relation.

(i) Reflexive: Let (a, b) be an arbitrary element of A × A. Then, we have $(a, b) \in A \times A \Rightarrow a, b \in A$

 $\Rightarrow a+b=b+a$ (by commutativity of addition on $A \subset N$)

 \Rightarrow (a, b) R (a, b)

Thus, (a, b) R (a, b) for all $(a, b) \in A \times A$. So, R is reflexive.

(ii) Symmetric: Let (a, b), (c, d) ∈ A×A such that (a, b) R (c, d)

 $\Rightarrow a+d=b+c \Rightarrow b+c=a+d$

 \Rightarrow c+b=d+a (by commutativity of addition on A \subset N)

(c, d) R (a, b).

Thus, $(a, b) R (c, d) \Rightarrow (c, d) R (a, b)$ for all (a, b), $(c, d) \in A \times A$. So, R is symmetric.

(iii) Transitive : Let (a, b), (c, d), (e, f) ∈ A × A such that

(a, b) R (c, d) and (c, d) R (e, f)

Now, $(a, b) R (c, d) \Rightarrow a + d = b + c$...(i)

and $(c, d) R(e, f) \Rightarrow c + f = d + e$

...(ii)

Adding (i) and (ii), we get (a + d) + (c + f) = (b + c) + (d + e)

 $\Rightarrow a+f=b+e \Rightarrow (a,b)R(e,f)$

Thus, (a, b) R (c, d) and $(c, d) R (e, f) \Rightarrow (a, b) R (e, f)$.

So, R is transitive. .. R is an equivalence relation.

Equivalence class of $[(2,5)] = \{(x,y) \in N \times N : (x,y) R(2,5)\}$

 $=\{(x,y) \in N \times N : x+5=y+2\}$

 $= \{(x, y) \in N \times N : y = x + 3\} = \{(x, x + 3) : x \in A\}$

= {(1, 4), (2, 5), (3, 6), (4, 7), (5, 8), (6, 9)}.

Answer Tips (

First, prove the given relation is an equivalence relation and then find the equivalence class by using the given relation.

 Here, R = {(x, y) | x ∈ N, y ∈ N and 2x + y = 24} $R = \{(1, 22), (2, 20), (3, 18), ..., (11, 2)\}$

Domain of $R = \{1, 2, 3, 4, ..., 11\}$

Range of $R = \{2, 4, 6, 8, 10, 12, ..., 22\}$

R is not reflexive as if $(2, 2) \in R \Rightarrow 2 \times 2 + 2 = 6 \neq 24$

In fact R is neither symmetric nor transitive.

⇒ R is not an equivalence relation.

 (i) Reflexive: Let (a, b) be an arbitrary element of N \times N. Then, $(a, b) \in N \times N$

 \Rightarrow ab(b + a) = ba(a + b)

[by commutativity of addition and multiplication on N]

 \Rightarrow (a, b) R (a, b)

So, R is reflexive on $N \times N$.

(ii) Symmetric: Let (a, b), (c, d) ∈ N × N such that

(a, b) R (c, d).

 \Rightarrow ad(b+c) = bc(a+d) \Rightarrow cb(d+a) = da(c+b)

[by commutativity of addition and multiplication on N]

Thus, $(a, b) R (c, d) \Rightarrow (c, d) R (a, b)$ for all (a, b), $(c, d) \in N \times N$. So, R is symmetric on $N \times N$.

(iii) Transitive: Let (a, b), (c, d), (e, f) ∈ N × N such that

(a, b) R (c, d) and (c, d) R (e, f). Then,

 $(a,b) R (c,d) \Rightarrow ad(b+c) = bc(a+d)$

$$\Rightarrow \frac{b+c}{bc} = \frac{a+d}{ad} \Rightarrow \frac{1}{b} + \frac{1}{c} = \frac{1}{a} + \frac{1}{d}$$
...(i)

and $(c, d) R (e, f) \Rightarrow cf(d + e) = de(c + f)$

$$\Rightarrow \frac{d+e}{de} = \frac{c+f}{cf} \Rightarrow \frac{1}{d} + \frac{1}{e} = \frac{1}{c} + \frac{1}{f} \qquad ...(ii)$$

Adding (i) and (ii), we get

$$\left(\frac{1}{b} + \frac{1}{c}\right) + \left(\frac{1}{d} + \frac{1}{e}\right) = \left(\frac{1}{a} + \frac{1}{d}\right) + \left(\frac{1}{c} + \frac{1}{f}\right)$$

$$\Rightarrow \frac{1}{b} + \frac{1}{e} = \frac{1}{a} + \frac{1}{f} \Rightarrow \frac{b+e}{be} = \frac{a+f}{af}$$

 \Rightarrow $af(b+e) = be(a+f) \Rightarrow (a,b) R (e,f)$

So, R is transitive on $N \times N$.

Hence, R is an equivalence relation.

We have, A = {x ∈ Z:0≤x≤12}

∴ A = {0, 1, 2, 3, ..., 12}

and $S = \{(a, b) : |a - b| \text{ is divisible by 4}\}$

Reflexive : For any $a \in A$, |a - a| = 0, which is divisible

by 4. Thus, $(a, a) \in R$:. R is reflexive.

(ii) Symmetric: Let (a, b) ∈ R

|a - b| is divisible by 4 \Rightarrow

 \Rightarrow |b - a| is divisible by 4 \Rightarrow (b, a) \in R

i.e., $(a,b) \in R \Rightarrow (b,a) \in R : R$ is symmetric.

(iii) Transitive: Let (a, b) ∈ R and (b, c) ∈ R

|a - b| is divisible by 4 and |b - c| is divisible by 4

⇒ a - b = ± 4k₁ and b - c = ± 4k₂; ∀ k₁, k₂ ∈ N

⇒ (a - b) + (b - c) = ± 4 (k₁ + k₂); ∀ k₁, k₂ ∈ N

⇒ $a-c=\pm 4(k_1+k_2)$; $\forall k_1, k_2 \in N$

⇒ |a - c| is divisible by 4 ⇒ (a, c) ∈ R ∴ R is transitive.

Hence, R is an equivalence relation.

The set of elements related to 1 is {1, 5, 9}.

Equivalence class for [2] is {2, 6, 10}.

Concept Applied (6)

In a relation R in a set A, the set of all elements related to any element $a \in A$ is denoted by [a]

i.e., $[a] = \{x \in A : (x, a) \in R\}$

Here, [a] is called an equivalence class of $a \in A$.

25. We have, A = [1,2,3,4,5]

and $R = \{(a, b) : |a - b| \text{ is divisible by 2}\}$

(i) Reflexive: For any a ∈ A,
|a - a| = 0, which is divisible by 2

Thus, $(a, a) \in R$: R is reflexive.

(ii) Symmetric: Let $(a, b) \in R$

⇒ |a - b| is divisible by 2

 \Rightarrow |b-a| is divisible by $2 \Rightarrow (b,a) \in R$

i.e., $(a, b) \in R \Rightarrow (b, a) \in R$:: R is symmetric.

(iii) Transitive: Let (a, b) ∈ R and (b, c) ∈ R

 \Rightarrow |a - b| is divisible by 2 and |b - c| is divisible by 2

 \Rightarrow $a-b=\pm 2 k_1$ and $b-c=\pm 2k_2$; $\forall k_1, k_2 \in N$

 \Rightarrow $(a-b)+(b-c)=\pm 2(k_1+k_2); \forall k_1,k_2 \in N$

⇒ $(a-c) = \pm 2(k_1 + k_2)$; $\forall k_1, k_2 \in N$

 \Rightarrow |a-c| is divisible by $2 \Rightarrow (a,c) \in R$.: R is transitive.

Hence, R is an equivalence relation.

Further R has only two equivalence classes, namely [1] = [3] = [5] = [1, 3, 5] and [2] = [4] = [2, 4].

26. (d): We have, $f(x) = 4 + 3 \cos x$, $\forall x \in R$

At
$$x = \frac{\pi}{2}$$
, $f(\frac{\pi}{2}) = 4 + 3\cos\frac{\pi}{2} = 4 \implies f(-\frac{\pi}{2}) = 4 + 3\cos(-\frac{\pi}{2}) = 4$

Since,
$$f\left(\frac{\pi}{2}\right) = f\left(-\frac{\pi}{2}\right)$$
, But $\frac{\pi}{2} \neq -\frac{\pi}{2}$

Therefore, f is not one-one.

As $-1 \le \cos x \le 1$, $\forall x \in R \Rightarrow 1 \le 4 + 3\cos x \le 7$, $\forall x \in R$

 \Rightarrow $f(x) \in [1, 7]$, where [1, 7] is subset of R. \therefore f is not onto.

Concept Applied 6

⇒ Range of cos x is [-1, 1].

27. (d): $:: f: X \to Y$ is one-one, if different element of X have different image in Y under f. But here, no such situation is possible.

28. (d): Given
$$f(x) = \frac{1}{x}$$
, for all $x \in R$

At $x = 0 \in R$, f(x) is not defined.

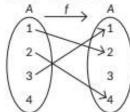

29. (c): Given,
$$f(x) = \begin{cases} \frac{n+1}{2}, & \text{if } n \text{ is odd} \\ \frac{n}{2}, & \text{if } n \text{ is even} \end{cases}$$

Now,
$$f(1) = \frac{1+1}{2} = 1$$
, $f(2) = \frac{2}{2} = 1$

 \Rightarrow f(1) = f(2) but $1 \neq 2$... f is not one-one.

But f is onto (: range of f is N.)

We have, A = {1, 2, 3, 4} function f: A → A is one-one and f(1) = 2, f(2) = 4, f(3) = 1, f(4) = k

As f is one-one, so no two element of A has same image in A.

$$f(4) = 3 \implies k = 3$$

Concept Applied (6)

- For a function to be one-one, no two elements should have the same image in A.
- 31. (i) Here n(B) = 3 and n(G) = 2
- .. Number of relation from B to G = 23x2 = 26
- (ii) Number of functions formed from B to G = 23 = 8
- (iii) We have, $R = \{(x,y)=x \text{ and } y \text{ are students of the same sex}\}$
- ∴ R is reflexive as (x, x) ∈ R.

R is symmetric as $(x, y) \in R \Rightarrow (y, x) \in R$.

Since, $(x, y) \in R$ and $(y, z) \in R \Rightarrow (x, z) \in R$

Hence, R is an equivalence relations.

OF

We have $f: B \rightarrow G$ be defined by $f = \{(b_1, g_1), (b_2, g_2), (b_3, g_1)\}$ Since, elements b_1 and b_3 have the same image, therefore, the functions is not one-one but it is many one functions. Since, every element in G has its pre-image in B, so the functions is onto.

For bijection, function should be one-one and onto both. Hence, the function is surjective but not injective.

32. The function $f:R - \left\{-\frac{4}{3}\right\} \rightarrow R$ is given by $f(x) = \frac{4x}{3x+4}$.

One-one: Let $x, y \in R - \left\{-\frac{4}{3}\right\}$ such that f(x) = f(y)

$$\Rightarrow \frac{4x}{3x+4} = \frac{4y}{3y+4}$$

$$\Rightarrow$$
 4x(3y + 4) = 4y(3x + 4) \Rightarrow 12xy + 16x = 12xy + 16y

$$\Rightarrow$$
 16x = 16y \Rightarrow x = y

:. f is one-one.

Onto: Let y be an arbitrary element of R. Then f(x) = y

$$\Rightarrow \frac{4x}{3x+4} = y \Rightarrow 4x = 3xy + 4y \Rightarrow 4x - 3xy = 4y \Rightarrow x = \frac{4y}{4-3y}$$

As
$$y \in R - \left\{ \frac{4}{3} \right\}, \frac{4y}{4 - 3y} \in R$$

Also,
$$\frac{4y}{4-3y} \neq \frac{-4}{3}$$
 as if

$$\frac{4y}{4-3y} = -\frac{4}{3} \Rightarrow 12y = 12y - 16$$
, which is not possible.

Thus,
$$x = \frac{4y}{4-3y} \in R - \left\{-\frac{4}{3}\right\}$$
 such that

$$f(x) = f\left(\frac{4x}{3x+4}\right) = \frac{4\left(\frac{4y}{4-3y}\right)}{3\left(\frac{4y}{4-3y}\right)+4} = \frac{16y}{12y+16-12y} = \frac{16y}{16} = y$$

So, every element in $R - \left\{ \frac{4}{3} \right\}$ has pre-image in $R - \left\{ -\frac{4}{3} \right\}$

:. fis not onto.

33. Given,
$$f(x) = \frac{x}{1+|x|}, x \in (-\infty, 0)$$

$$= \frac{x}{1-x} \qquad (\because x \in (-\infty, 0), |x| = -x)$$

For one-one: Let $f(x_1) = f(x_2), x_1, x_2 \in (-\infty, 0)$ Hence, R is transitive. (1) Equivalence class containing 0 i.e., $\frac{x_1}{1-x_1} = \frac{x_2}{1-x_2} \implies x_1(1-x_2) = x_2(1-x_1)$ $[0] = {..., -4, -2, 0, 2, 4, ...}$ (1/2) \Rightarrow $x_1 - x_1x_2 = x_2 - x_1x_2 \Rightarrow x_1 = x_2$ We have, a relation R on X such that, $(A, B) \in R$ iff $A \subset B$ Thus, $f(x_1) = f(x_2)$, $\Rightarrow x_1 = x_2$ Reflexive: Clearly every set is a subset of itself. :. f is one-one \Rightarrow $(A, A) \in R$ For onto : Let f(x) = yR is reflexive. (1) \Rightarrow $y = \frac{x}{1-x} \Rightarrow y(1-x) = x \Rightarrow y-xy = x$ Symmetric: Let $(A, B) \in R$ ⇒ A ⊂ B $\Rightarrow x + xy = y \Rightarrow x(1+y) = y \Rightarrow x = \frac{y}{1+y}$ ⇒ B is a super set of A. (1/2)Here, $y \in (-1, 0)$ \Rightarrow $B \not\subset A \Rightarrow (B,A) \not\in R$ So, x is defined for all values of y in codomain. :. f is onto. R is not symmetric. (1) Transitive: Let $(A, B) \in R$ and $(B, C) \in R$, for all $A, B, C \in P(X)$ Concept Applied (6) \Rightarrow A \subset B and B \subset C \Rightarrow A \subset B \subset C (1/2)A function f: A → B is called \Rightarrow $A \subset C \Rightarrow (A, C) \in R$.. R is transitive. (i) one-one or injective function, if distinct (1)elements of A have distinct images in B. Hence, R is reflexive and transitive but not symmetric. (1/2)i.e., for $a, b \in A$, $f(a) = f(b) \Rightarrow a = b$ (ii) onto or surjective function, if for every element Reflexive: Let $(a, b) \in N \times N$. Then ab = ba $b \in B$, there exists some $a \in A$ such that f(a) = b. (By commutativity of multiplication of natural number) \Rightarrow (a, b) R (b, a) CBSE Sample Questions Thus, (a, b) R (b, a) for all $(a, b) \in N \times N$ So, R is reflexive. (1)(b): We have, $(1, 2) \in R$ but $(2, 1) \notin R$ Symmetric: Let (a, b), $(c, d) \in N \times N$ such that (a, b) R (c, d)So, (1, 2) should be removed from R to make it an \Rightarrow ad = bc \Rightarrow bc = ad \Rightarrow cb = da equivalence relation. (By commutativity of multiplication of natural numbers) (a): We have, R = {(a, b): |a - b| is a multiple of 4} \Rightarrow (c, d) R (a, b) The set of elements related to 1 is [1, 5, 9]. Thus, (a, b) R (c, d) = (c, d) R (a, b) for $(a, b), (c, d) \in N \times N$ So, equivalence class for [1] is [1, 5, 9] (1) So, R is symmetric. (1)Number of reflexive relations on a set having n Transitive: Let (a, b), (c, d), $(e, f) \in N \times N$ such that elements = $2^{n(n-1)}$ (a, b) R (c, d) and (c, d) R (e, f) So, required number of reflexive relations = $2^{3(3-1)} = 2^6$ (1) Now, $(a, b) R (c, d) \Rightarrow ad = bc$...(i) We have, R = {(1, 1), (2, 2), (3, 3), (1, 2)} and $(c, d) R(e, f) \Rightarrow cf = de$...(ii) which is reflexive and transitive. Multiplying (i) and (ii), we get $ad \cdot cf = bc \cdot de$ (1)For R to be symmetric (1, 2) should be removed from R. (1) \Rightarrow af = be \Rightarrow (a, b) R (e, f) As we know that, union of all equivalence classes of a Thus, (a, b) R (c, d) and $(c, d) R (e, f) \Rightarrow (a, b) R (e, f)$ (1)set is the set itself. So, R is transitive. $A_1 \cup A_2 \cup A_3 = A$ Also, $A_1 \cap A_2 \cap A_3 = \phi$.. R is an equivalence relation. (1)[: Equivalence classes are either equal or disjoint] (1) (b): As every pre-image x ∈ A, has a unique image y ∈ B. Let $(a, b) \in R$ and $(b, c) \in R$. Then, 2 divides (a - b) and ⇒ f is injective function. (1)2 divides (b - c): where $a, b, c \in Z$ (d): Let x₁, x₂ ∈ R be such that f(x₁) = f(x₂) So, 2 divides [(a-b)+(b-c)] $\Rightarrow x_1^3 = x_2^3 \Rightarrow x_1 = x_2 \Rightarrow f \text{ is one-one.}$ ⇒ 2 divides (a - c) ⇒ (a, c) ∈ R. So, relation R is transitive. Let $f(x) = x^3 = y$ for some arbitrary element $y \in R \implies x = y^{1/3}$ (1)Equivalence class of $0 = \{0, \pm 2, \pm 4, \pm 6, ...\}$ (1) \Rightarrow $f(v^{1/3}) = v$ Every image $y \in R$ has a unique pre-image in R. Reflexive: Since, a + a = 2a which is even. ∴ (a, a) ∈ R ∀ a ∈ Z ⇒ fis onto f is one-one and onto. (1)Hence, R is reflexive. (1/2)(ii) Symmetric: If (a, b) ∈ R, then a + b = 2λ ⇒ b + a = 2λ Let f(x₁) = f(x₂) for some x₁, x₂ ∈ R. ⇒ (b, a) ∈ R. Hence, R is symmetric. (1) $\Rightarrow (x_4)^3 = (x_2)^3$ (iii) Transitive: If (a, b) ∈ R and (b, c) ∈ R then $a+b=2\lambda$ (i) and $b+c=2\mu$... (ii) ⇒ x₁ = x₂, hence f(x) is one-one. (1)Adding (i) and (ii), we get Since √a is not defined for a ∈ (-∞, 0) $a+2b+c=2(\lambda+\mu) \Rightarrow a+c=2(\lambda+\mu-b)$ ∴ R={(a,b): √a=b} is not a function. $\Rightarrow a+c=2k$, where $k=\lambda+\mu-b\Rightarrow (a,c)\in R$ (1)
